Updated Submission by

VerificAge – Biometric Age Verification Online, in real time

http://www.verificage.com

Since our initial TAB submission we have been making progress on a number of issues which we would like to bring to the attention of the ISTTF.

1. After much focusing effort on cost reduction, manufacturing planning and sourcing we have managed to bring down the retail price of our biometric age verification product to $49 per unit (on large scale orders the price will be substantially lower). We believe this will have a dramatic impact on the availability and appeal of the product to a wider audience.

2. We have added functionality which allows the users (mainly children) to issue a challenge to the other party during a peer to peer interaction in order to re-assert the other party's age group. This functionality empowers young users to increase their confidence and trust in the other party and involves them in the process of acknowledging and protecting themselves from the potential threats of the net.

3. Web use is rapidly expanding beyond the realm of the desktop, making the challenge of ensuring a safe web experience ever more tough. VerificAge is hard at work on developing a new generation of its core technology which is better suited for mobile device integration. The new generation will have a dramatically smaller form factor, suited for embedding in mobile phones and other mobile handheld devices. VerificAge is committed to bringing its technologies for safe internet usage to the rapidly expanding mobile web.
